*\*Custom upgrades for storage and bandwidth are available.*

## **Definitions of Terms:**

**Addon domain.** A domain name that points to a subdirectory within your account. For example, you may want **innovation.org.nz** to point to **business.org.nz/innovation/**. Addon domains must be registered domain names that you own and are configured to point to your web site's servers.

**CGI (Common Gateway Interface).** CGI is a standard for interfacing external applications with information servers, such as HTTP or Web servers. A plain HTML document that the Web daemon retrieves is static, which means it exists in a constant state: a text file that doesn't change. A CGI program, on the other hand, is **executed** in real-time, so that it can output **dynamic** information. Not all web hosts support CGI scripts; our Hyacinthz Designz hosting package does and includes several preinstalled scripts which can be accessed through your account C-panel.

**Parked Domain.** A domain name that you own can be set up to point to another domain name. This is known as "parking" a domain. For example, you own the **business.co.nz** and **innovation.co.nz** domain names. You already have a web site for business.co.nz, but you do not want to create a new web site for innovation.co.nz at the moment. By parking innovation.co.nz on top of business.co.nz, all URLs for innovation.co.nz will automatically go to business.co.nz instead.

**SQL (Structured Query Language).** SQL is an international standard in querying and retrieving information from databases. **MySQL** is essentially an SQL server - it responds to requests for information that are written in SQL. You can communicate with MySQL using a wide variety of programming languages (PHP being one of the most common).

**Subdomain.** A subdomain is a separate account set up within your master account, which is accessed as a separate URL. For example, you could set up a "timber" subdomain on your master account "hardware.org.", which would be accessed as "timber.hardware.org." A lot of larger businesses use subdomains to establish branding and focus on separate product lines, because a subdomain creates a separate URL and web presence.
